Closeout Copilot

AI-Powered Payout Reconciliation

CHAOS TO CLOSEOUT IN SECONDS

Time is money. We save you both.

Workers paid wrong. Clients overcharged. Ops teams drowning.

Every shift is a three-way trust problem. When it's not reconciled, everyone pays.

The worker

Paycheck is wrong. Or late. Or both. They chase what they're owed — and the next shift becomes "no thanks."

Trust is paid in the same currency as wages.

The end client

Overcharged for hours nobody worked. Undercharged when the platform eats the loss. Reconciliation overhead scales linearly with shifts.

Either way the relationship corrodes.

The staffing platform

Float payroll they shouldn't carry. Legal risk for misclassified hours. Churn workers on one side, clients on the other.

NPS dies on both ends.

Today this is patched by ops teams of 50+ reconciling shifts by hand. **The math stops working past a certain scale.**

Live with US staffing leaders

Real customers. Real shifts. Real payroll.

Wonolo

 **GIGSMART**

In production. Reconciling shifts across the US.

There Is No Single Timesheet

Your T&A data comes from multiple sources — all different, all conflicting.

Customer Systems 🏢

Hardware at facilities, QR codes, paper clipboards, tab-based systems — all controlled by the customer.

Paper sheets, photographed and uploaded

Time Tracking 🕒

Web-based time tracking or app-based geofence clocking from your MSP, your own system, or provider.

Often unreliable data

Location Intelligence 📍

Background location and geofencing from mobile apps — the ground truth of where workers actually were.

Few customers have this today

What's the actual T&A for this shift?

Payout

How much do I pay the worker?

Billing

How much do I invoice the customer?

Today, ops teams manually reconcile every shift.

🕒 Slow

⚠️ Error-prone

📈 Unscalable

You pay workers now

You're a fintech company

Even if you don't know it

Customers pay you later

Closeout Copilot Gets It Done

How We Do It Better

AI Copilot 🤖

When data is missing, the copilot talks to workers, supervisors, and customer systems to retrieve it. Human-like coordination, automated.

Does what a human would do

Location Intelligence 📍

Background location, geofencing, and clock-in geotags provide ground truth that paper can never match.

Know exactly where workers were

Exception Handling ⚠️

Cross-reference sources, detect anomalies, surface plan vs. actual variances. Flag what needs attention.

Catch what humans miss

Fast. Accurate. Scalable.

Additional data + better algorithms + human-like coordination

Built as a real agent. Not a wrapper.

A per-shift Claude agent that calls tools, applies versioned rulebooks, and shows its work.

Multi-step reasoning 📅

Reconciles 4+ conflicting evidence sources per shift: schedule, supervisor sign-off, mobile clock, location intelligence.

Resolves conflict like a human

Tool use 🔌

Calls scheduling, time-tracking, location, and notification APIs to gather evidence and dispatch outreach mid-conversation.

Talks to every system

Rulebook-driven 📖

Customer escalation tiers, refund authority, source-priority logic — versioned, A/B-evaluable, human-readable.

Customer rules, not hardcoded heuristics

Eval-driven iteration 🎯

Run a rule change against the last 100 shifts before promoting. Langfuse traces every input, tool call, and decision rationale end-to-end.

Auditable from input to outcome

Built on Claude. Running on AWS. India + US team.

Agents become the system of record

Manual reconciliation worked when staffing platforms processed thousands of shifts a month. Networks processing millions can't catch every discrepancy by hand — and the cost is paid in inaccurate payouts, delayed invoices, and worker churn.

Closeout Copilot is the first agent purpose-built to **be** the system of record for shift payroll — not a copilot beside a human, but an autonomous decision-maker that's auditable, opinionated, and right by default.

AGENTIC AI IS FINALLY GOOD ENOUGH TO TAKE THIS SEAT. WE'RE TAKING IT.

Connected to Customer Systems

Ready adapters to the billing and payout platforms our customers already run.
